

APB eProtocol BIOLOGICAL AGENTS/PERSONNEL Table Guide

In your Administrative Panel on Biosafety (APB) eProtocol, you will find a new matrix, titled “BIOLOGICAL AGENTS/PERSONNEL TABLE” in the AGENTS USED section. This table will be used to help clarify which biological agent(s) specific personnel listed on the APB will use. This information will be used by both Biosafety and Stanford University Occupational Health to help assess any medical requirements needed for the researcher.

There will be two ways to select the correct biological agent and personnel pairing.

- 1) In the AGENTS USED section, you will be able to select the biological agents used by each personnel by clicking the link [“Click here to Show All BIOLOGICAL AGENTS/PERSONNEL TABLE”](#). This will open an auto-populated table containing the personnel and biological agents listed in the protocol. Select the appropriate biological agents used by each personnel by clicking on the corresponding check boxes.
- 2) In the AGENTS USED section, under “Biological Agents”, by opening or adding a specific biological agent you will be able to select personnel for that agent in the pop up window.

Please see the following pages for a visual guide of this new process.

If you have any questions please contact biosafety-owner@lists.stanford.edu

APB eProtocol BIOLOGICAL AGENTS/PERSONNEL Table Guide

The new Biological Agents/Personnel table (See green box below) can be found on the bottom of the **AGENTS USED** section (blue circles) in your APB.

Agents Used

Information on many infectious agents can be found at: <http://www.phac-aspc.gc.ca/lab-bio/res/psds-ftss/index-eng.php>.

Biological Agents

	Biological Agent	BS Level	Strain and Source of agent	Personnel
☐	Influenza Virus	BSL-2	Seasonal influenza viral strains, obtained from the NIH	
☐	Salmonella typhi	BSL-2	typhi, Minnesota	
☐	Zika Virus	BSL-2	Puerto Rico, Stanford	
☐	Vaccinia Virus	BSL-2	Modified Vaccinia Ankara (MVA), SHC Labs	
☐	Adenovirus vectors (Replication defective) strains Ad5, 25, 36	BSL-2	Ad5, Ad26, Ad36, Fairchild Labs.	

1. Provide antibiotic/antiviral drug resistance profile for specific strain of agent(s) to be used in project
Salmonella typhi strains are susceptible to first-line agents including ampicillin. See attached Biogram.

2. Concentration and volumes of agents generated. Will volumes in excess of 10 liters be generated?
Volumes will not be excess of 10 liters.
Virus: 10⁶-10⁸ PFU/mL, 5-10 mL.
Salmonella: 10⁵-10⁷ CFU/mL, 5-10 mL.

Please complete the table below by indicating which agent(s) are used by each personnel now or within the next year. If personnel will not be working with any agent(s), please select "N/A (No work)". This information will be used by Biosafety and Occupational Health to assess any medical requirements for the researcher(s) based on the agents used.

APB eProtocol BIOLOGICAL AGENTS/PERSONNEL Table Guide

METHOD 1: Selection of Biological Agent and Personnel Pairs through the BIOLOGICAL AGENTS/PERSONNEL TABLE

Please complete the table below by indicating which agent(s) are used by each personnel now or within the next year. If personnel will not be working with any agent(s), please select "N/A (No work)". This information will be used by Biosafety and Occupational Health to assess any medical requirements for the researcher(s) based on the agents used.

- For each personnel (see green box): Choose the biological agent that they are working it with by clicking the corresponding checkbox (orange circle).
- Click “Save” after all selections have been made (blue circle).
- Clicking on “Export” will allow you to save an excel spreadsheet version of this table (purple circle).
